PRODUCT MANAGER | ROBOTICS, AI & AUTONOMOUS SYSTEMS

PROFESSIONAL SUMMARY

Product manager for robotics and autonomous systems, with a mechanical engineering background (B.Tech; MSc, University of Glasgow), business management training (NMIMS) and 5+ years across product management, business development and software engineering. I own the full cycle from customer discovery and technical requirements through to delivery, across defence, aerospace, industrial automation and enterprise software, and the commercial side with it: bid strategy, pricing and financial planning for defence programmes worth ₹2 crore. I prototype what I specify, in firmware as well as software.

PROFESSIONAL EXPERIENCE

Product Manager, Trinnovate Synergy Technologies Pvt. Ltd. Feb 2025 – Present

- Run **4 active projects** in perception systems and smart inspection end to end, aligning client engineering teams with internal development, planning integration and driving delivery.
- Own the lifecycle of **6+ robotics and autonomous-system initiatives**: discovery, PRDs, SOWs, technical specifications, prioritisation, unblocking engineering and client delivery.
- Delivered an **automated blade inspection system for jet engines**, inspecting aerospace turbine components in real time on a conveyor line and cutting manual intervention.
- Built working prototypes of a **cloud-based multi-robot fleet management platform** and a face-recognition attendance system for international schools.
- Primary interface for **defence, public-sector and academic customers** including Western Command, the Indian Naval Academy, the Indian Navy, PSUs and IIT Jammu, translating operational problems into scoped, costed technical requirements.
- **Converted 4 of 10+ GeM bids into orders** and built an active pipeline of over ₹2 crore, owning the technical proposal, feasibility assessment, pricing, demonstrations and negotiation.
- **Led financial planning for two defence programmes worth ₹2 crore** for Central Command — a camera-controlled drone system and a co-axial drone launcher adapted from a missile launcher — covering cost estimation, budgeting and pricing from proposal through delivery.
- Introduced the **PRISM execution framework** across a **20+ member engineering intern team**, improving ownership, collaboration and delivery consistency.
- Drove product demonstrations, customer workshops, technical presentations and investor discussions in support of business development.

Business Development Executive, Geo Lands Doctor (Remote) Sep 2024 – Dec 2024

- Built **3 market-entry models** for expanding a digital-twin product into Canada, assessing segment fit, entry route and positioning.
- Delivered competitive analysis that fed directly into leadership's go-to-market decision.
- Reached out to 50+ organisations, generating 15+ qualified conversations through segment-specific messaging.

Front-End Engineer, Cognizant Dec 2019 – Dec 2021

- Built 10+ production React interfaces for high-volume stock and billing workflows, gathering requirements directly from operations users.
- Worked with backend and operations teams on reliability and performance; mentored 5 engineers in React.

SELECTED PROJECTS

Costing & Quotation Platform for Startups — Common Ground View project

- Building a platform that streamlines costing, scoping, quotation and revision workflows for startups and small engineering teams.

- Designed its negotiation workspace: compares offers side by side on full cost and margin against a minimum-margin threshold, models alternatives such as a paid pilot instead of a discount, and keeps internal reasoning separate from the customer-facing response. Working prototype.

Desk Buddy — Multi-Surface AI Desk Assistant (ESP32-S3 + Python) Personal project, 2026

- Designed and built an AI assistant with a hardware face and a software brain: custom LVGL firmware on an ESP32-S3 round display (expressions, blink, touch reactions, live lip-sync) driven by a Python application over a shared USB-serial and Wi-Fi UDP command protocol, with verified over-the-air updates.
- **Diagnosed a display-driver fault** that persisted across two graphics libraries, two init sequences and a reduced clock rate, isolating it to the vendor's own library builds; documented the working configuration so the setup is reproducible.
- **Benchmarked 7 speech and vision workloads** by memory and latency to decide what could run on a Raspberry Pi 5 versus the laptop before committing spend.
- Ran it as a product: a 6-phase roadmap with defined deliverables and dependencies, a costed bill of materials with selection rationale, and dated design decisions (brain kept local for privacy and zero running cost).

Additive Manufacturing — Spinodoid Lattice Structures University of Glasgow, 2023

- Built MATLAB and Python predictive models linking electrical and mechanical properties across 500+ data points from 35 printed samples.

SKILLS

- **Product:** product strategy and roadmapping · requirement gathering and prioritisation · PRDs, SOWs and technical specifications · stakeholder management · product lifecycle ownership · go-to-market support
- **Technical:** robotics and automation · perception systems and machine vision · embedded firmware (ESP32, C++, LVGL) · Python, React.js, Django, MATLAB · Postgres · Docker and CI/CD · AWS and Azure (basic)
- **Business operations:** defence and public-sector procurement (GeM) · bid and proposal management · project costing, budgeting and pricing · market research and competitive analysis · client engagement

EDUCATION

MSc Mechanical Engineering (Merit), University of Glasgow, UK, 2022 – 2023

Diploma in General Business Management, NMIMS, India, 2021 – 2022

B.Tech Mechanical Engineering, KL University, India, 2016 – 2020
